Overview

SITRANS F US clamp-on ultrasonic flowmeters provide highly accurate measurement while minimizing installation time and maintenance expense.

Benefits

- Easy installation; no need to cut pipe or stop flow
- Minimal maintenance; external transducers do not require periodic cleaning
- No moving parts to foul or wear
- No pressure drop or energy loss
- Wide turn-down ratio
- Choice of single, dual or multiple channel versions and a variety of enclosures - to suit your operating conditions and requirements

Application

SITRANS F US clamp-on ultrasonic flowmeters have six product families, each targeting specific applications:

**FUS1010 and FUP1010** General purpose flowmeters are suitable for a wide variety of liquid applications, including the following:
- Water industry
  - Raw water
  - Potable water
  - Chemicals
- Wastewater industry
  - Raw sewage
  - Effluent
  - Sludges
  - Mixed liquor
  - Chemicals
- HVAC industry
  - Chillers
  - Condensers
  - Hot & cold water systems
- Power industry
  - Nuclear
  - Fossil
  - Hydroelectric
- Processing industry
  - Process control
  - Batching
  - Rate indication
  - Volumetric and mass measurement

**FUE1010 Energy flowmeters** are ideally suited to thermal energy / power industry applications, including:
- Chilled water sub-metering
- Hot water sub-metering
- Condenser water
- Glycol
- Thermal storage
- Lake source cooling

**FUH1010 Oil flowmeters** are ideal for applications carrying crude oil, refined petroleum or liquefied gas. There are three application areas: Interface detectors, volumetric flowmeters and mass or standard volume flowmeters

- Precise identification of interfaces on multi-liquid pipelines
- Rapid and precise scraper "pig" indication
- Product identification
- Density indication

**FUG1010 Gas flowmeters** are ideal for most natural and process gas industry applications, including:
- Checkmetering
- Allocation
- Flow survey verification
- Lost and unaccounted for (LAUF) analysis
- Production
- Storage

**FUS1020 General purpose flowmeters** are suitable for most clean liquid applications, including the following:
- Water & wastewater industry
  - Potable water
  - Wastewater, influent & effluent
  - Processed sewage, sludge
- Chemical feed industry
  - Sodium hypochlorite
  - Sodium hydroxide
- HVAC & power industries
  - Coolant flow
  - Fuel flow
- Process control
  - Chemicals
  - Pharmaceuticals
Overview

The thickness gauge is used to measure the wall thickness of the pipe that a clamp-on ultrasonic flowmeter is installed on. The wall thickness value is a vital factor in the flow computation model and a prerequisite for precise clamp-on ultrasonic flow measurement. When measuring any pipe wall thickness the thickness gauge can also be used as a stand-alone tool used to measure the wall thickness of any metallic or non-metallic pipe materials capable of acting as an ultrasonic wave conductor.

Benefits

The thickness gauge is an indispensable tool in accurate clamp-on ultrasonic flow measurement. For a flowmeter to measure correctly it needs to know the exact wall thickness of the pipe it is measuring on. Since even the smallest miscalculation can have a major effect on the flow reading, the pipe thickness gauge has to be extremely precise. This is why the standard probe operates at a 5 MHz frequency making it capable of measuring pipe thickness ranging from 0.1 to 200 mm (0.03” to 7.9”) with a very high resolution of up to 0.1 mm (0.004”).

Application

The thickness gauge can be used in any field application where there is a need for flow measurement including but not limited to:

- Water and wastewater
- Energy measurement
- Oil and gas industries

Design

The hand-held micro-processor controlled gauge is designed to measure the thickness of various metallic or non-metallic pipe. Such materials include steel, aluminum, titanium, plastics and ceramics. Measurement results are shown in either inches or millimeter, only a simple pre-calibration to a known thickness or sound velocity is required. The simple-to-read 4-digit LCD display featuring a basic user friendly menu is easily navigable with only three conveniently located push buttons. The lightweight computing unit weighs a mere 150 g (5.3 oz) making it ideal for quick and easy on-site pipe wall thickness measurement and with two AAA alkaline batteries trouble-free operation is ensured for 250 hours.

Function

The thickness gauge measurement is based on the transit time ultrasonic wave propagation principle: a high frequency ultrasonic beam is shot into the pipe being measured through a probe acting as a sender and receiver. When the probe subsequently retrieves that same signal, an internal counter calculates the time taken for the signals to be sent and received through the pipe. This value is used to evaluate the speed of sound through the pipe and consequently, the thickness of the pipe wall.

### Pipe material

| Steel pipe with liquid temperature > 60 °C (140 °F) | X | X | Special order high precision transducers can be request for temps > 60 °C but < 120 °C (248 °F) |
| Steel | X | O | | |
| Steel pipe with diameter/wall thickness ratio <10 | O | X | | |
| Non-steel pipe material (copper, ductile iron, cast iron, etc.) | O | X | High precision transducers can also be used on plastic and aluminum pipes |
| Wall thickness > 25.4 mm (1") | O | X | | |

O = not suitable  X = preferred choice
Function

Operating Principle

The SITRANS FUS1010 system is a transit-time ultrasonic meter that provides exceptional performance using a non-invasive clamp-on approach. Ultrasonic transducers transmit and receive acoustic signals directly though the existing pipe wall, where the fluid refraction angle is governed by Snell’s law of refraction.

\[
\sin \theta = \frac{c}{V_p}
\]

\(c\) = Velocity of sound in fluid

\(V_p\) = Phase velocity (a constant in the pipe wall)

The flowmeter automatically compensates for any change in fluid sound velocity (or beam angle) in response to variations in the average transit-time between transducers A and B. By subtracting the computed fixed times (within the transducers and pipe wall) from the measured average transit-time, the meter can then infer the required transit-time in the fluid (\(T_{\text{Fluid}}\)).

\[
v = \frac{V_p}{2 \cdot \Delta t} \cdot \frac{1}{T_{\text{Fluid}}}
\]

Once the raw flow velocity is determined, the fluid Reynolds number (Re) must be determined to properly correct for fully developed flow profile. This requires the entry of the fluid’s kinematic viscosity (visc) as shown in the equations below, where \(Q\) represents the final flow profile compensated volumetric flow rate.

\[
\text{Re} = \frac{D_i \cdot v}{\text{visc}} = K(\text{Re}) \cdot \left( \frac{\pi}{4} \cdot D_i^2 \right) \cdot v
\]

\(v\) = Flow velocity

\(\text{visc} = \frac{\mu}{\rho} = \) (dynamic viscosity / density)

\(K(\text{Re}) = \) Reynolds flow profile compensation

In all wetted type ultrasonic flowmeters the meter constants are configured prior to leaving the factory. As this is not possible with clamp-on meters, the settings must be made by the customer at the time of installation. These settings include pipe diameter, wall thickness, liquid viscosity, etc.

SITRANS Clamp-On meters that include temperature sensing can be configured to dynamically infer changes in fluid viscosity for the purpose of computing the most accurate flow profile compensation (\(K_{\text{visc}}\)).

Ultrasonic Transducer Types

Two basic types of Clamp-On transducers can be selected for use with the SITRANS FUS1010 flowmeter. The lower cost “universal” transducer is the most common type in the industry and is suitable for most single liquid application where the sound velocity does not vary much. This transducer type can be used on any sonically conductive pipe material (including steel) making it well suited for portable survey applications. Universal transducers are selected based on the pipe diameter range alone, so wall thickness is not important to the selection process.

The second transducer type is the patented WideBeam transducer (called high precision), which utilizes the pipe wall as a kind of loudspeaker to optimize the signal to noise ratio and provide a wider area of vibration. This makes this kind of transducer less sensitive to any change in the fluid medium.

The WideBeam transducer is designed for steel pipes, but can also be used with aluminum, titanium and plastic pipe. It is the preferred transducer for HPI and gas applications. Note that unlike the universal type, this transducer selection is dependent only on the pipe’s wall thickness.

Automatic Zero Drift Correction (ZeroMatic Path™)

When WideBeam transducers are installed in the “Reflect” mode configuration shown below, the acoustic signal travels in two different paths between transducers A and B. One path “ACB” travels through the pipe wall and fluid, while the other path “AB” never enters the fluid medium.

\[
\text{This later path provides the meter with a reference signal that is completely independent of flow rate and can therefore be used as a measure of transducer “mis-match”. By continually analyzing this pipe wall signal the FUS1010 meter can dynamically correct for flow errors caused by zero drift.}
\]

Multi-Channel Flowmeters

For improved flow profile averaging, redundancy, or better cost per measurement, Clamp-On meters can be supplied with 1 or 2 measurement channel, with 4 channel meters supplied as special order.

In the standard FUS, FUP, FUE systems, these channels can be installed on separate independent lines or in a multi-beam installation as shown below. This choice is made during meter setup, where either a multi-beam (two beams on same pipe) or multi-channel installation can be selected.
The Doppler measurement technique relies on the reflection of sound energy off tiny gas bubbles or suspended particles to create a doppler shift in the fixed frequency acoustic transmit signal, as shown below.

When de-demodulated using FFT signal processing, this doppler shifted frequency (Δf) can be used to measure the flow rate as described in the associated doppler equations below.

Although the standard transit-time measurement system is very tolerant of high levels of liquid aeration and high solids content, there will be cases where insufficient signal will be available for operation with transit-time mode. For these cases the FUS, FUP and FUE meters can be ordered with this optional doppler capability, which requires an additional doppler transducer.

**SITRANS meter family description**

**SITRANS FUS1010 flowmeters**

The FUS1010 system is a basic function permanent (or dedicated) clamp-on meter that is available with a full range of safety approvals, I/Os and enclosure types. This meter can be used in a wide range of applications but does not include the special functions found in the hydrocarbon FUH and energy FUE meters.

The FUS1010 meter is typically programmed with a fixed viscosity and specific gravity entry, which can limit the mass flow and volumetric flow accuracy when highly variable (multi-product) liquid properties flow through the same pipeline.

If this meter is ordered with the Type 3 hardware and program configuration, it will have the ability to accommodate clamp-on RTDs, or an analog input from a temperature transmitter. With an active measurement of liquid temperature the meter can then be programmed to compensate for changes in liquid density and viscosity by mean of a “UniMass” table (for advanced users).

**SITRANS FUS1020 flowmeters**

The FUS1020 system has the same basic function of the FUS1010 system, but does not include the same I/O capability or safety approval rating of the FUS1010. This basic meter is intended for single liquid applications that do not require these additional features. Note that the FUS1020 is not available with hazardous area approvals.

**SITRANS FUP1010 Portable meters**

The FUP1010 meter has all the capabilities of the FUS1010 meter, but in a battery powered portable configuration. This meter is ideal for general flow survey work where high accuracy is required. Note that the FUP meter is not available with hazardous area approvals.

**SITRANS FUE1010 Energy meters**

By combining clamp-on transit-time flow measurement with accurate temperature differential measurement the FUE1010 system provides a solution to thermal energy metering with no interruption of service. Energy measurement can be provided for water, ethylene glycol and brine solutions or steam condensate.

Absolute and differential temperature measurement is accomplished with the use of 2 matched 1 kΩ RTD elements installed on the supply and return side of the heating or cooling system. Efficiency calculation (kW/ton, EER or COP) is also available in systems with the optional analog input capability, which allow the meter to accept a power meter output.

The FUE1010 system is available in both dedicated (IP65 (NEMA 4X)) and portable configurations (IP40).

**SITRANS FUG1010 Gas meters**

This unique Clamp-On gas meter uses the same WideBeam transit-time operating principle described above. However, due to the very low density and sound velocity characteristics of gases, this meter requires a high gain signal amplifier and the installation of a pipe damping material.

The pipe damping material consists of an adhesive backed viscoelastic film that is designed to attenuate any stray acoustic transmit energy that may otherwise interfere with the transit-time gas signal. Damping material installation requires a clean (grease free) pipe surface with well bonded paint.

The Clamp-On gas meter is capable of operation on most gases (natural gas, oxygen, nitrogen, carbon monoxide, etc) with a typical minimum operating pressure of 10 barg (145 psig). Low molecular weight gases such as helium or hydrogen can also be measured, but at a higher minimum pressure. **Be sure to contact a Siemens clamp-on specialist before placing a gas system order.**

Standard volume computation: The FUG1010 gas meter is not designed with the same capabilities of a volume compensating flow computer but it can provide a standard volume or mass flow output for fixed gas compositions. All FUG1010 Gas meters include analog input capability that can be used for pressure and temperature compensation. With the installation of an AGA8 lookup table this meter can dynamically adjust the compressibility factor (Zact) in response to changes in gas pressure and temperature, as indicate below.

\[ \text{Std. Rate} = Q_{\text{act}} \cdot R_{\text{act}}/P_{\text{base}} \cdot T_{\text{act}}/T_{\text{base}} \cdot Z_{\text{act}}/Z_{\text{base}} \]

**SITRANS FUH1010 Hydrocarbon meters**

There are two models of flowmeters included in the FUH1010 family, a viscosity compensated model, used for applications that will flow a wide range of viscosity, and a standard volume (Masse) model. Both models rely on a variable referred to as "liquid", which is used to infer the liquid’s viscosity and optionally
the liquid's density. This variable represents the measured liquid sonic velocity compensated by the operating temperature and pressure, so for a given liquid product the measured liquid output will remain constant over a wide range of pressure or temperature.

PV (Viscosity Compensation) Option:
This is the lower cost FUH meter option that uses the liquident variable to infer only the actual liquid viscosity. This meter does NOT provide the standard volume, mass flow, liquid identification or density output available in the DV meter option described below. The PV meter is suitable for any petroleum application where actual volume required as the input to an external RTU or flow computer.

DV (Standard Volume) Option:
This Liquident variable can also be used to identify the liquid's name (gasoline, fuel oil, crude oil, etc) as well as it's physical properties (specify gravity, API, viscosity and compressibility) at base conditions. With this information the meter can be configured to output a temperature and pressure compensated (Standard) volume flow rate using the API 2540 and API MPMS chapter 11.2.1 methods as shown below.

Correction for Temperature:
Compute Thermal Expansion Coefficient ($\alpha_b$):
$$\alpha_b = \frac{K_O}{\rho_b^2} + \frac{K_1}{\rho_b}$$
where: $K_O$ and $K_1$ are constants dependent on type of liquid and $\rho_b$ is the liquid density at base conditions

Compute temperature correction factor ($K_T$):
$$K_T = \rho_b \times \exp\left(-\alpha_b \Delta T \left(1 + 0.8 \alpha_b \Delta T\right)\right)$$
where: $\Delta T = (T - \text{base temperature})$

Correction for Pressure:
Compute Compressibility Factor (F):
$$F = \exp(A + B T + \left(C + D T\right)/\rho_b^2)$$
where: $A$, $B$, $C$ and $D$ are constants, and $T$ is liquid temperature

Compute pressure correction factor ($K_P$):
$$K_P = 1 / (1 - F (P_{act} - P_{base}) \times 10^{-4})$$

Final Volume Correction: $Q_{std} = Q_{act} \times K_T \times K_P$

Available outputs from this meter include: API, Density, Mass Flowrate, Standard Volume Flowrate and Liquid Identification.

B (Interface Detection) Option:
This meter option is designed to provide all the Non-Flow capabilities of a DV meter, making it an ideal non-intrusive alternative to a densitometer, interface detector or pig detector. Be aware that this meter does NOT measure flow rate.

General Installation Guidelines for transit-time Clamp-On Transducers
• Minimum measuring range: 0 to ± 0.3 m/s velocity (see meter accuracy graph below for more detail)
• Maximum measuring range: 0 to ± 12 m/s (± 30 m/s for high precision transducers). Final flow range determination requires application review

Pipe must be completely full within the transducer installation volume for accurate flow measurement!
• Typical MINIMUM straight pipe requirements are: 10 diameters upstream / 5 diameters downstream. Additional straight run is required for double out-of-plane elbows and partially open valves. A minimum of 20 upstream diameters is recommended for clamp-on gas systems
• Transducers should be installed at least 20° off vertical for horizontal pipes. This reduces the chance of beam interference from gas buildup at the top of the pipe
• Operation inside the Reynolds transition region, between 1000 < Re < 5000 should be avoided for best accuracy
• Submersible and direct burial installations can be accommodated. Consult sales representative for details
• Ultrasonic coupling compound is provided with all transducer orders. Insure that a permanent coupling compound is used for long term installations
• Refer to the "Transducer type selection guide" to insure proper application of the equipment

- **Flow display computer (shown with cover open)**
- **Transducer cables**
- **Data/Control I/O**
- **Power In**
- **Mounting hole pattern (7.8 (0.31) diam. holes in mounting flanges)**
- **Graphic display (optional)**
- **Graphic display cable (optional)**
- **Keypad cable (optional)**
- **I/O**
- **System computer module**
- **Input power connector**
- **Flow display computer**
- **Model i.d. label**
- **Keypad security switch**
- **Tx/Rx module**
- **Transducer cables connectors**

**Note:**
- Net weight: 4.1 kg (9.0 lbs) max.

---

**FUS1010, FUH1010 and FUG1010 IP65 (NEMA 7) Compact explosionproof enclosure**

- **Optional alpha numeric display**
- **Viewing lens cover (zone B1)**
- **1/2"-14 male NPT fitting for customer's conduit fitting or cable gland**
- **3/4"-14 NPT for customer's conduit or gland fittings**
- **Power and data I/O wiring interface cover**
- **Optional magnetic wand (use for flowmeter setup, see field manual)**
- **Connect to earth ground**
- **Cover locking screws (2)**
- **Adapter and/or cable gland (by customer, or supplied with certain cables)**

**Note:**
- Net weight: 4.4 kg (9.8 lbs) max.
FUS1010 and FUH1010 IP66 (NEMA 7) Wall mount explosionproof enclosure

Single / Dual channel flowmeter

Multi-channel flowmeter

Note:
Net weight: 29 kg (64.0 lbs) max.
FUG1010 IP66 (NEMA 7) wall mount explosionproof enclosure

Single / Dual channel flowmeter

Multi-channel flowmeter

Note:
Net weight: 45 kg (99.0 lbs) max.
**FUP1010 IP67 Weatherproof impact resistant enclosure**

- Transducer, data/control and power cable connectors (see zone B5)
- Flow display computer test connector
- I/O port
- Flow transducer cable connectors
- View "A-A" (temp. sensor input option shown)
- RS 232 connector
- Auxiliary power/battery charger input
- Battery status indicator
- Temperature sensor cable connectors (optional)

Note:
Net weight: 3.64 kg (8.0 lbs.)

---

**FUP1010 IP40 (NEMA 1) Standard portable enclosure**

- Carry handle
- Shown in tiltstand position

Note:
Net weight: 3.4 kg (7.5 lbs.)
**FUE1010 IP40 (NEMA 1) Portable impact resistant enclosure**

- **Model / Serial number identification label (inside cover)**
- **Flow transducer cable connectors**
- **Pressure relief valve**
- **View “A-A”**

**Note:**
- Net weight: 3.5 kg (7.7 lbs)

---

**FUE1010 IP40 (NEMA 1) Portable enclosure**

- **Carry handle**
- **Carry handle shown in its stand position**

**Note:**
- Net weight: 3.4 kg (7.7 lbs)
FUS1020 IP65 (NEMA 4) Wall mount enclosure

Notes:
1. Net weight 1.4 kg (3.0 lbs)
2. Use conduit fittings or cable glands at all cable entries. Install weather tight seals at all unused holes.
